

livetec – medical technology, for the heart

livetec GmbH situated in Lörrach at the "Innocel" mainly but not only offers solutions for medical problems. Additional core capabilities are: excessively low-current „Wireless Communication" and contactless "Sensor Technology"

Founded 2002 livetec has 12 employees and is in cooperation with 5 freelancers.

Chief executive officers are Klaus Reichenbach and Michael Schirmeier. Together with Markus Bahlinger and Rainer Schwald they also are associates.

The border region with its' specialisation towards Biovalley, life science and medical technology is a positive potential for our business.

If it is customers' preference everything from one hand

livetec GmbH will be producing her own products in the future and offers engineering services for sensor technology and measurement and control technology. Main focus is on medical technology (cardiology, electrophysiology), communication technology and industrial remote

monitoring and diagnostics. livetec developed invasive heart stimulation units, f.e. temporary pacemakers or universal heart stimulators for best differential cardiac diagnostics.

Wireless communication standards, medically approved

Patients' parameters like heart frequency will be recorded by a reader and will be sent to a data processing centre or to the computer of the responsible cardiologist.

This technique will be the future for industrial, self- sustaining sensors or for medical implants, which generally have to fulfill highest standards and have to work with lowest power technology for years. livetec has a lot of experience about applications of medical units; this will be very important for the future.
